

* Applying Variable Life
Adjusted Display in
monitoring surgical
outcomes

Dr Yuen Wai Cheung
SOMIP Director
Quality and Safety Division
HA Convention 2013

* Key functions of Quality and Safety
Division HAHO

Target of SOMIP
monitoring

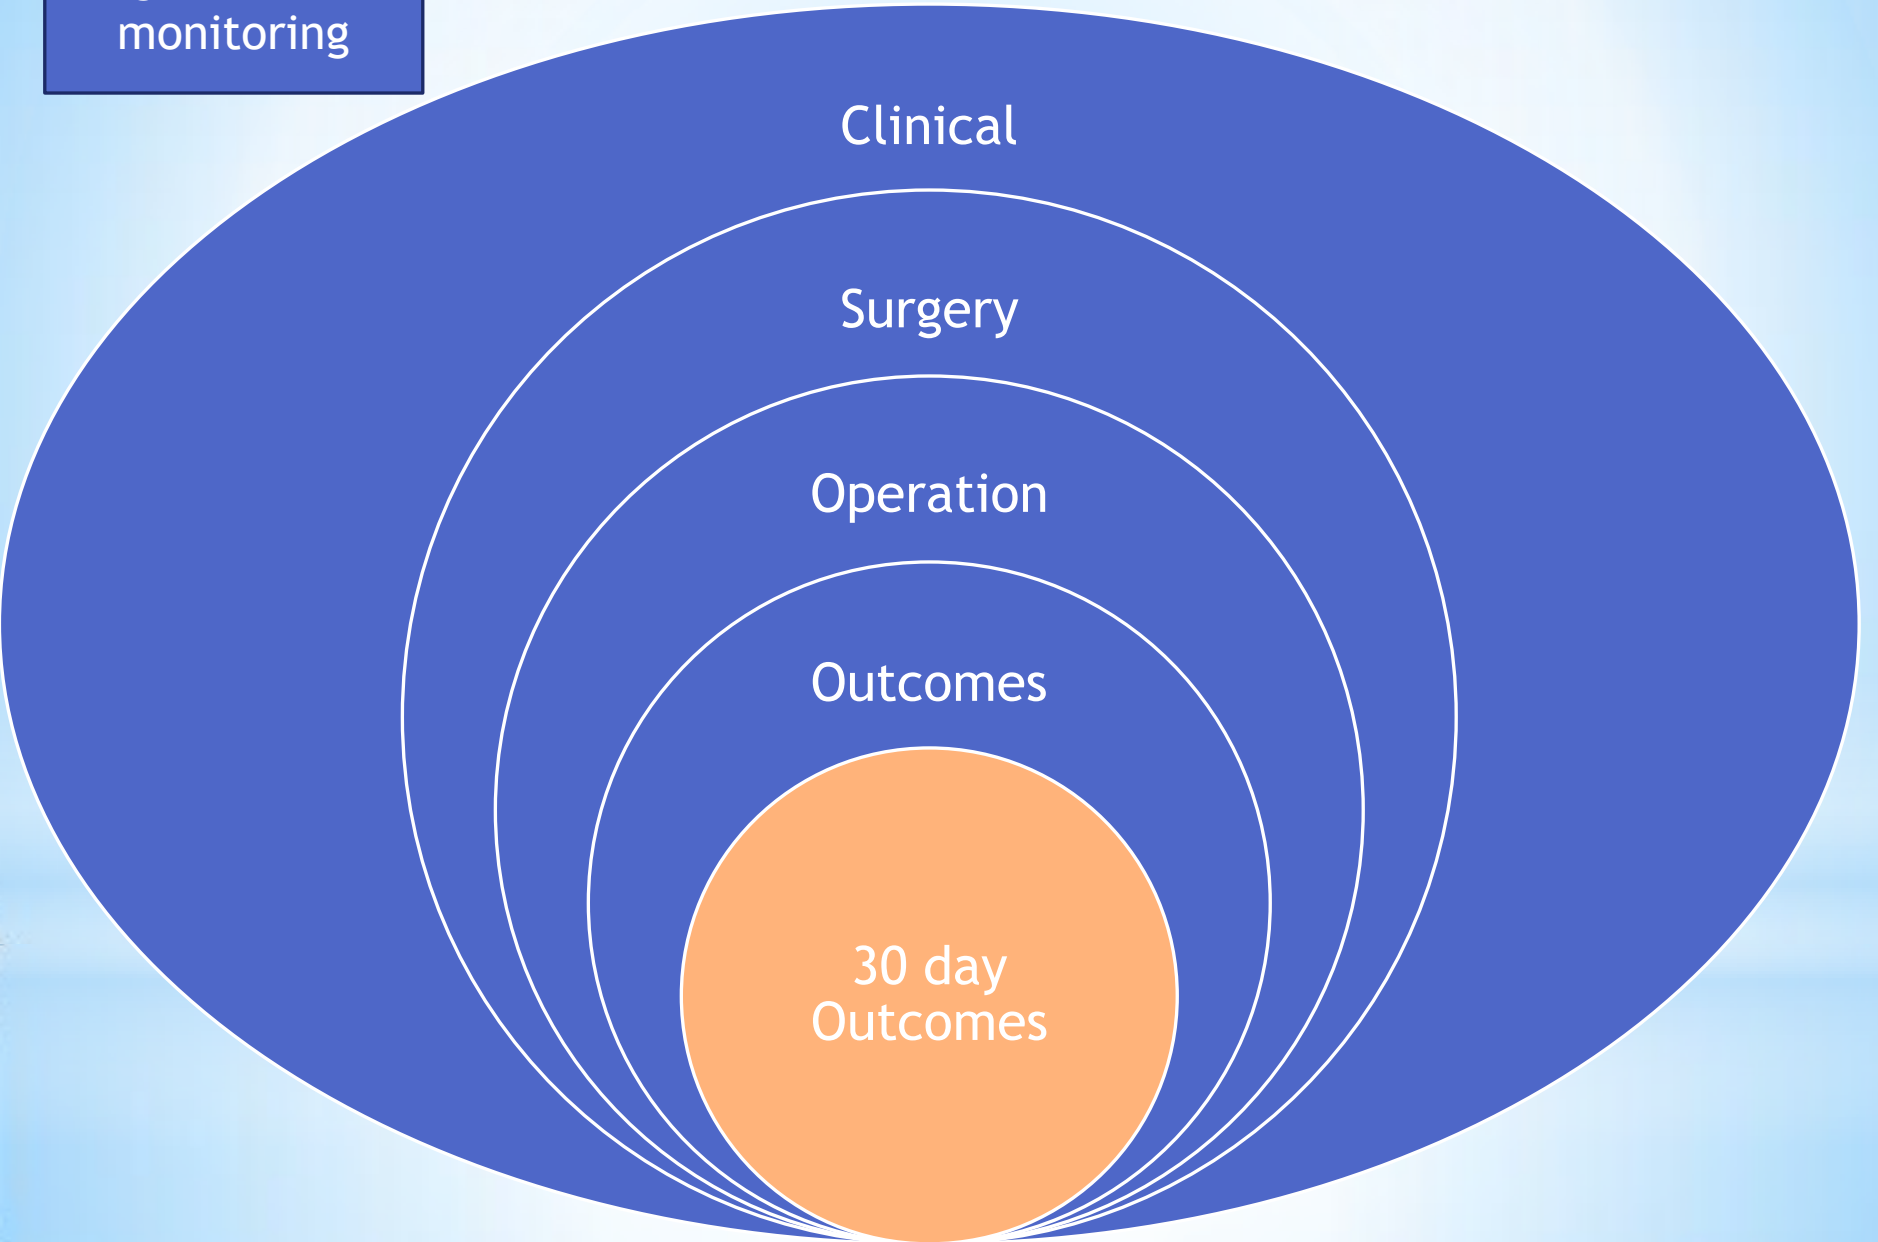

Clinical

Surgery

Operation

Outcomes

30 day
Outcomes

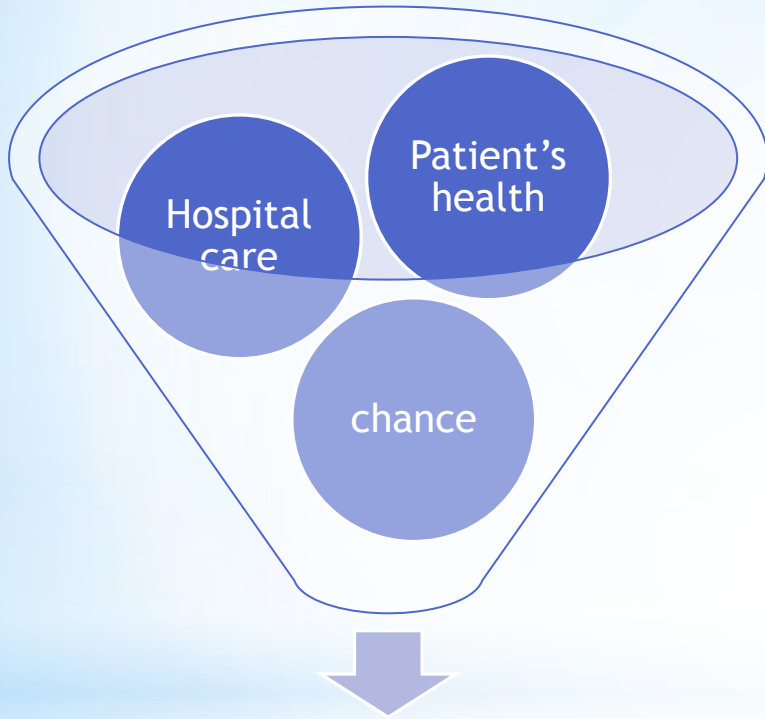

30 day crude mortality rate

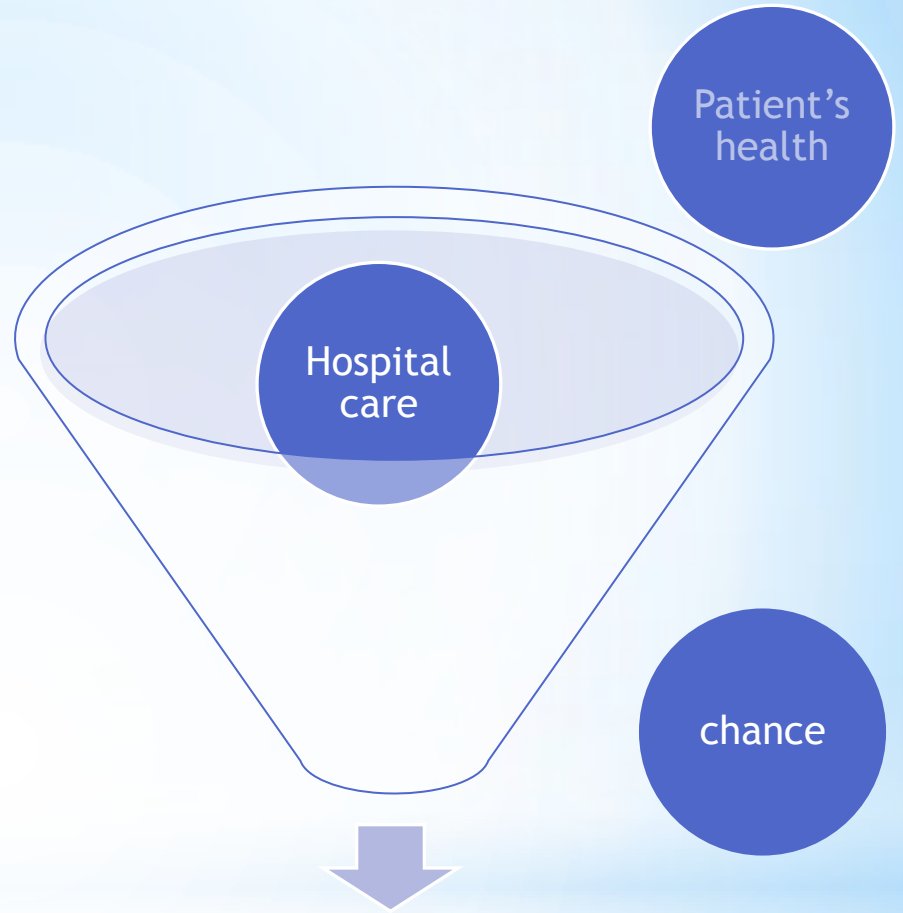

Source of data: SOMIP database Jul 2011 to Jun 2012

*** 608 patients died within 30 days after major or ultramajor operations in 17 HA hospitals in one year July 2011- June 2012**

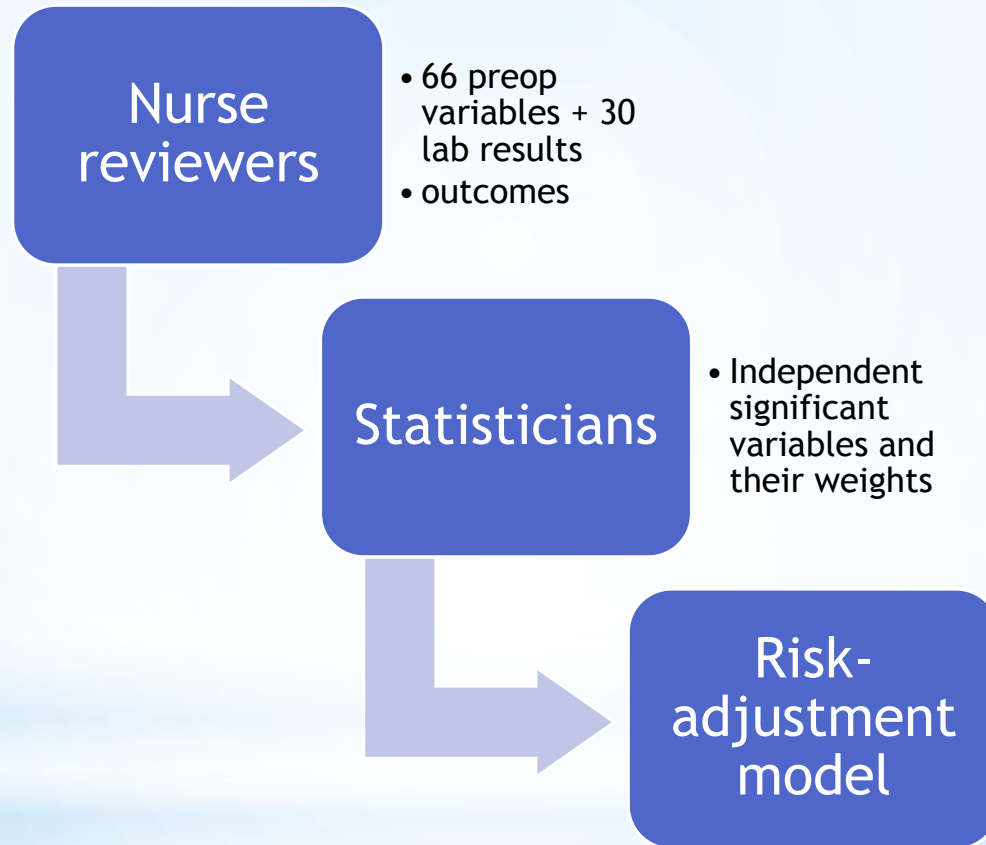

Crude outcomes

Risk-adjusted outcomes

- * HA has implemented **Surgical Outcomes and Improvement Program (SOMIP)** in all HA surgical departments since 2008.
- * The aim is to provide an appraisal to hospitals based on **risk-adjusted outcomes**
- * Short term outcomes (30days) of all major and ultra-major operations were monitored

* Background

* Methodology of SOMIP

* Model for emergency operations

$$P = \frac{e^z}{1+e^z}$$

$$\begin{aligned} \text{where } z = & \beta_0 + \beta_{sex} + \beta_{age} + \beta_{ASA} \\ & + \beta_{\text{magnitude}} + \beta_{\text{degree of emergency}} + \beta_{\text{severe COPD}} + \beta_{\text{renal failure}} + \beta_{\text{bleeding tendency}} \\ & + \beta_{\text{disseminated cancer}} + \beta_{\text{hypertension}} + \beta_{\text{steroid use}} + \beta_{\text{psychosis}} + \beta_{\text{alcohol}} \\ & + \beta_{\text{functional health status}} + \beta_{\text{weight loss}} + \beta_{\text{dyspnea}} + \beta_{\text{neurological status}} + \beta_{\text{ascites}} \\ & + \beta_{WBC} + \beta_{Sodium} + \beta_{Urea} + \beta_{Albumin} + \beta_{Bilirubin} + \beta_{Pulse} \end{aligned}$$

Model for elective operations

$$P = \frac{e^z}{1+e^z}$$

$$\begin{aligned} \text{where } z = & \beta_0 + \beta_{sex} + \beta_{age} + \beta_{ASA} \\ & + \beta_{\text{magnitude}} + \beta_{\text{ascites}} + \beta_{\text{disseminated cancer}} + \beta_{\text{hypertension}} + \beta_{\text{complexity score}} \\ & + \beta_{\text{functional health status}} + \beta_{\text{weight loss}} + \beta_{\text{dyspnea}} + \beta_{\text{gangrene}} + \beta_{WBC} \\ & + \beta_{Sodium} + \beta_{Urea} + \beta_{Creatinine} + \beta_{Albumin} + \beta_{Bilirubin} + \beta_{\text{alk Pase}} + \beta_{Pulse} \\ & + \beta_{\text{base excess}} + \beta_{\text{blood loss}} \end{aligned}$$

Nurse reviewers

- 66 preop variables + 30 lab results

Statisticians

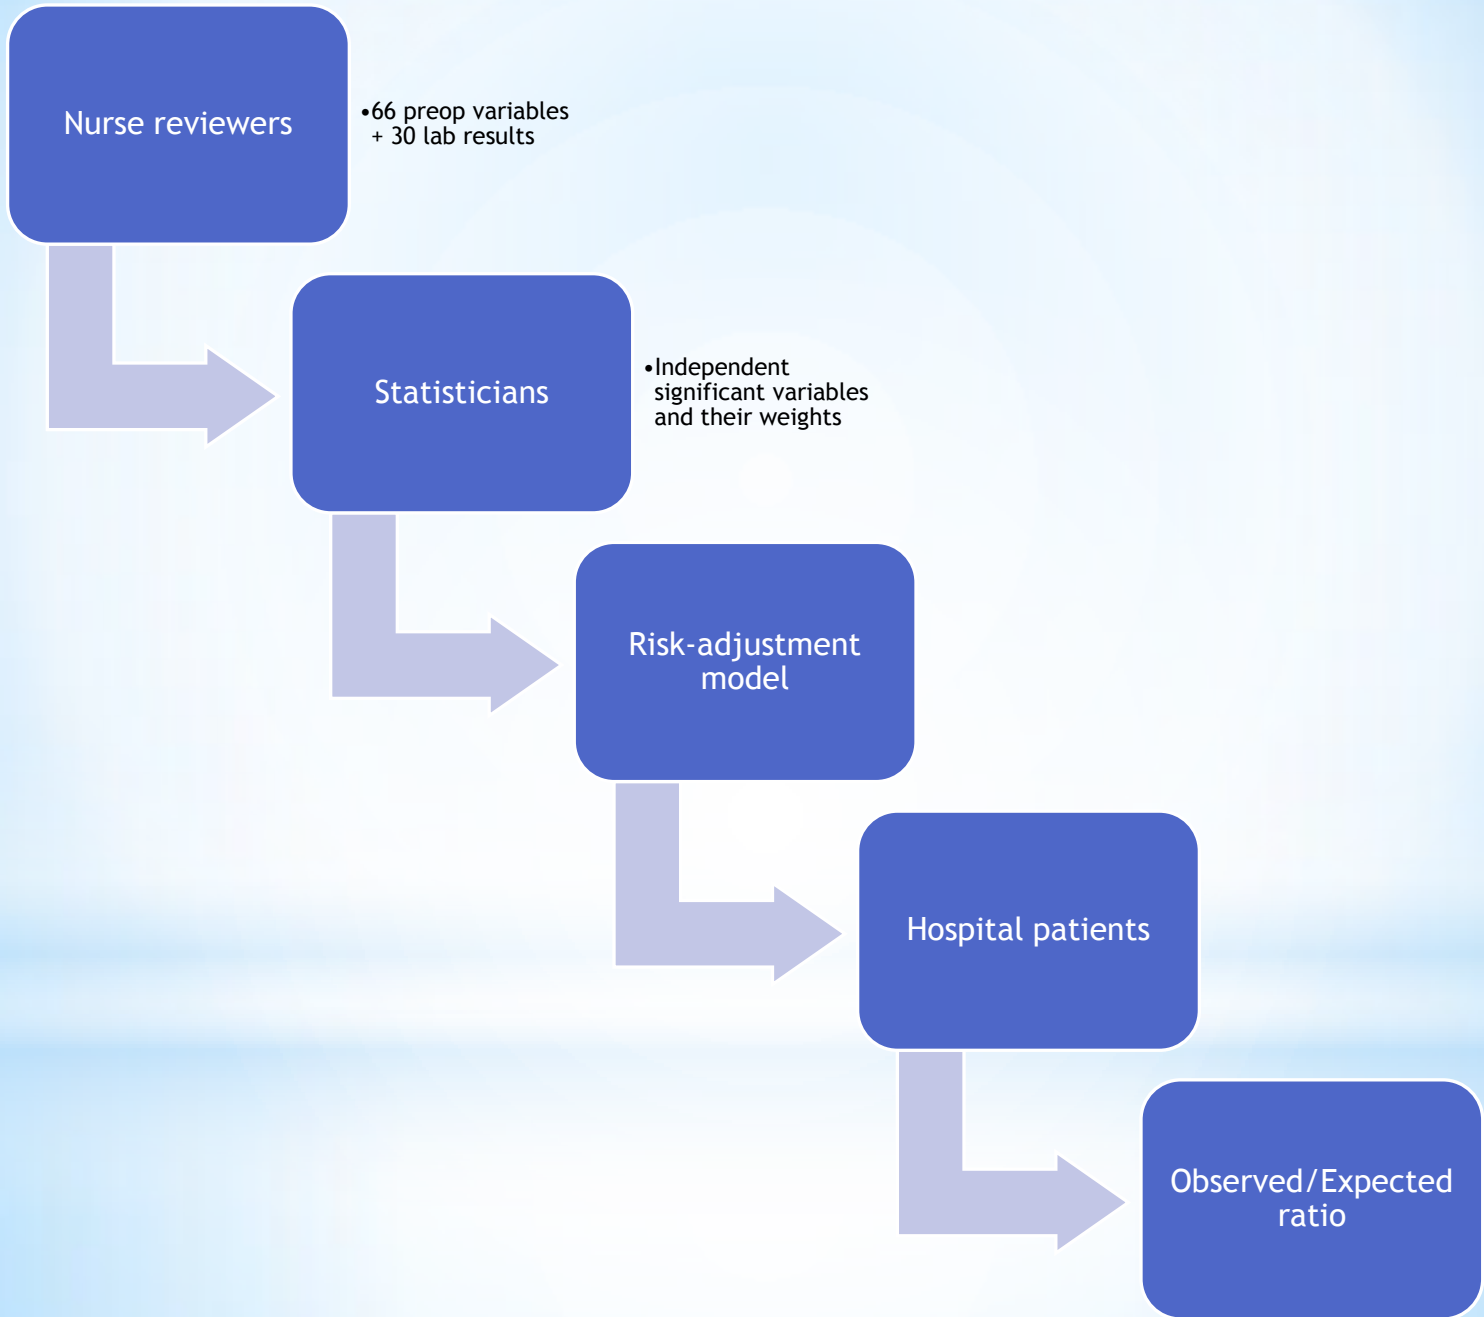

- Independent significant variables and their weights

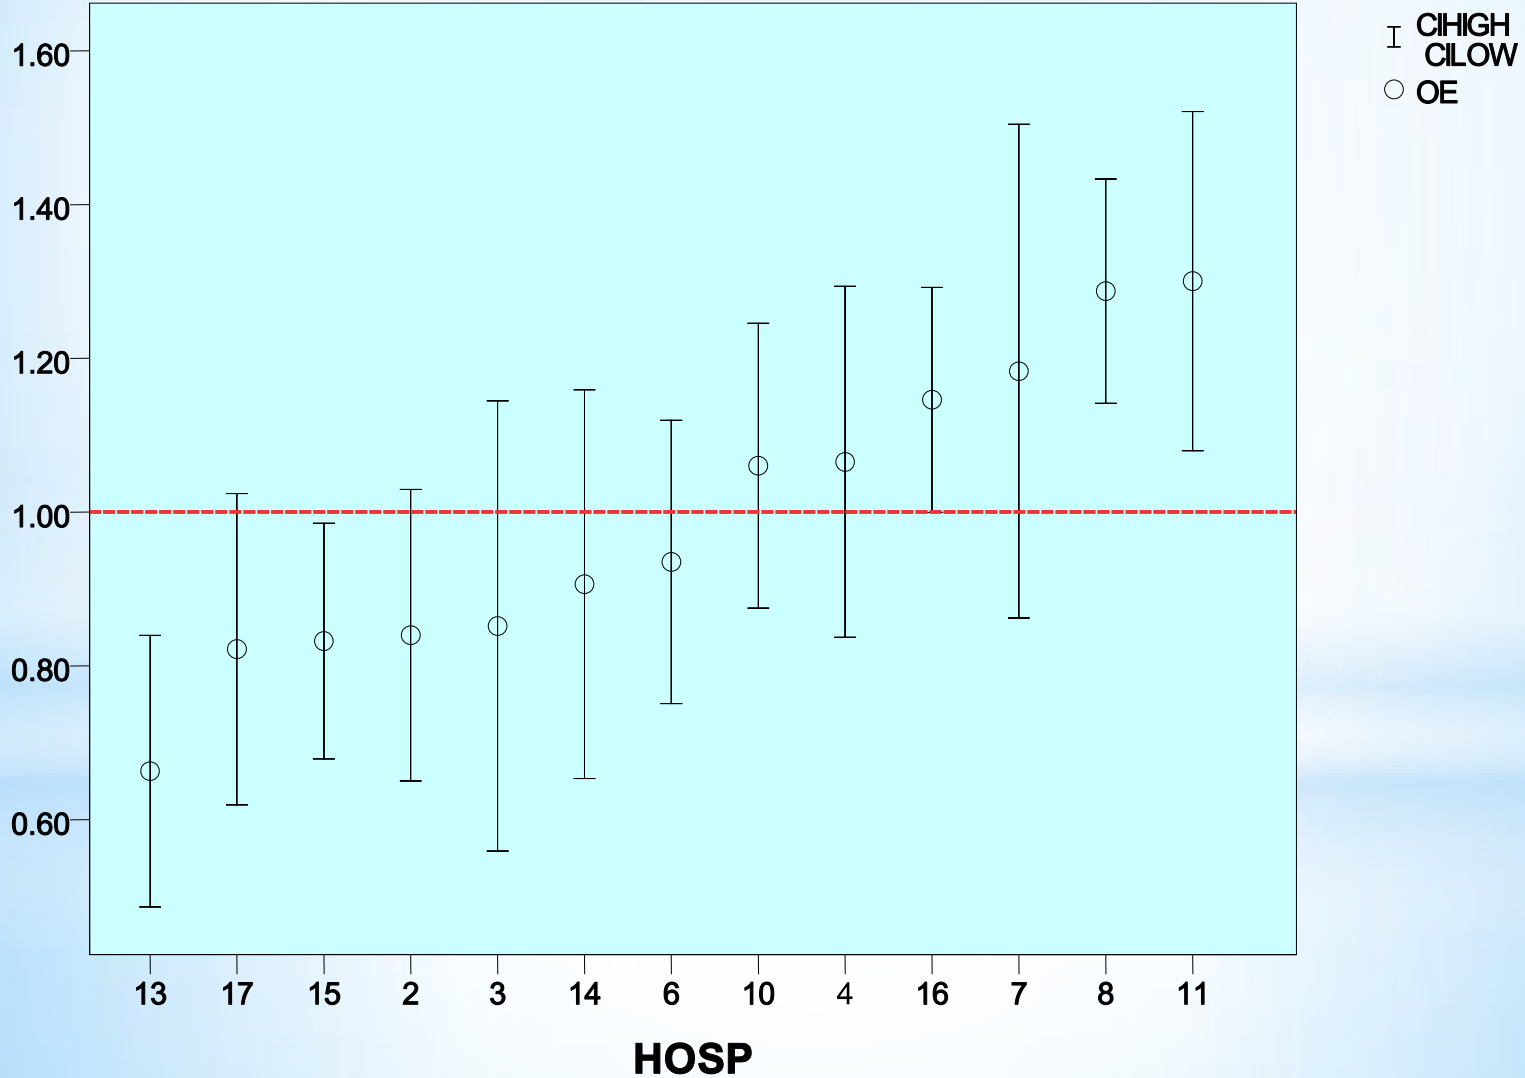

Risk-adjustment model

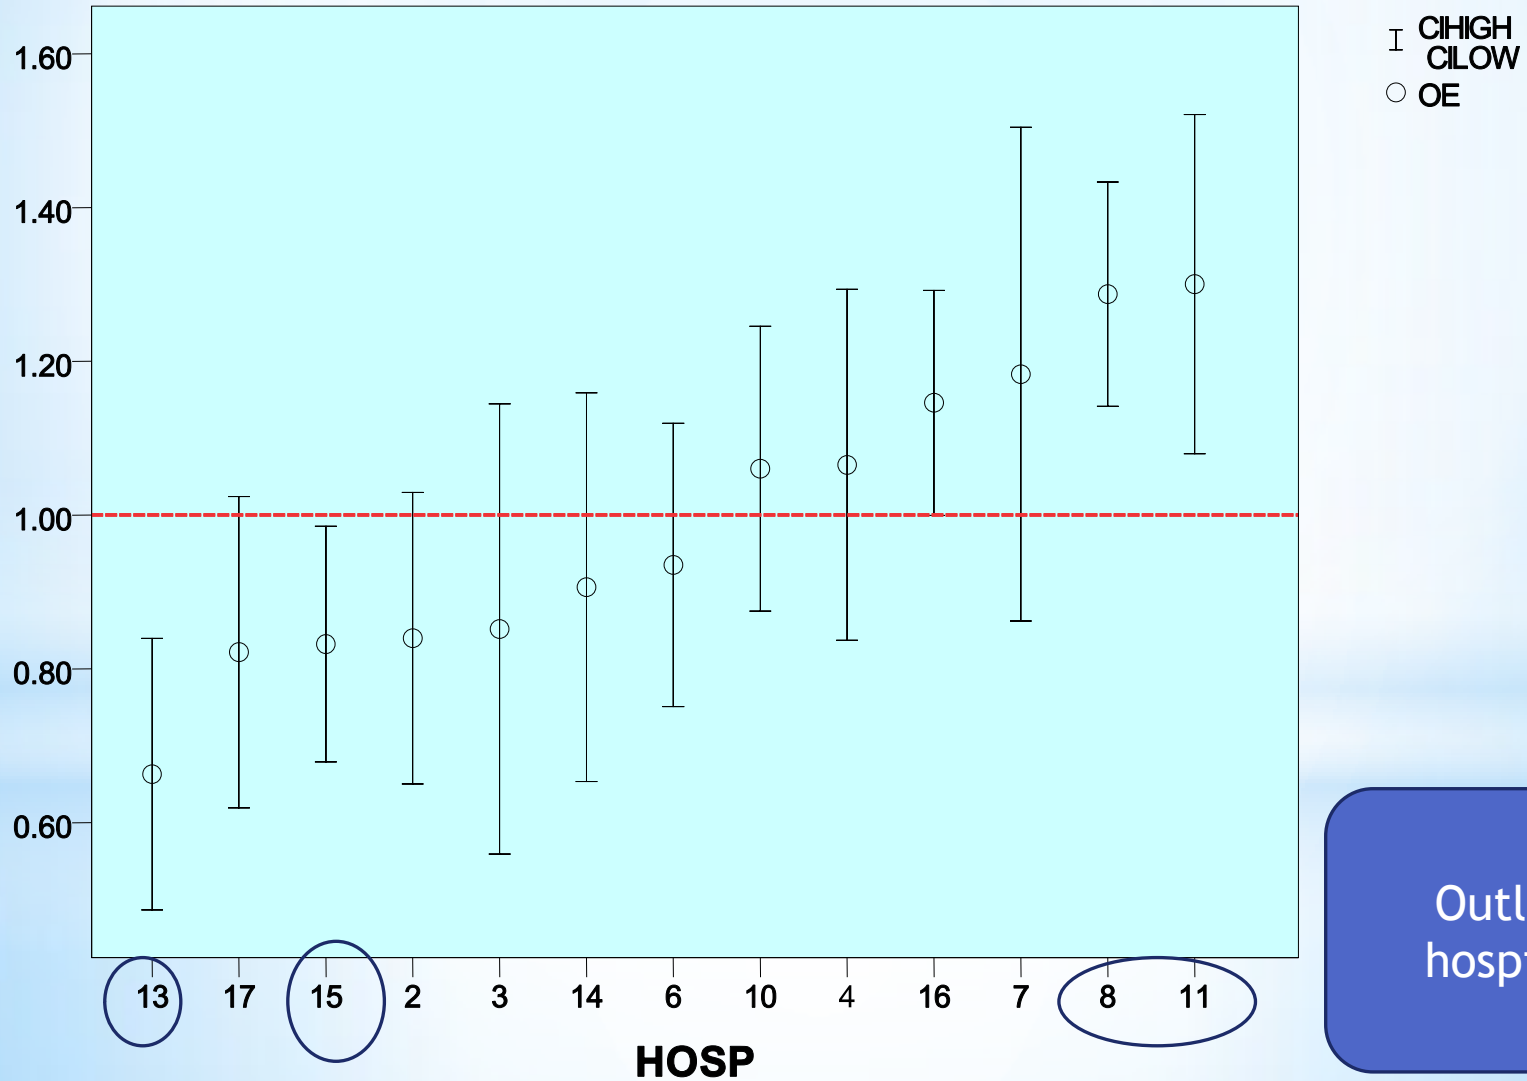

Hospital patients

O/E Ratio and 90% CI for 30-day Mortality following Emergency Surgery

O/E Ratio and 90% CI for 30-day Mortality following Emergency Surgery

Outliers
hospitals

- * Starting in this year, we introduced VLAD to provide more information to hospital of their past performance

* Variable Life Adjusted Display (VLAD)

- * The vertical axis shows the cumulative difference between the expected mortality and the actual deaths
- * Every case is plotted on a horizontal axis
- * Survivors: move up; death: go down
- * The risk calculated by the SOMIP risk-adjusted model determines the magnitude the graph ascends or descends

* Variable Life - Adjusted Display (VLAD)

Variable Life - Adjusted Display (VLAD)

Probability of death by individual case

Cumulative net live saved and lost

30 day Mortality for Emergency Operation in Hospital X
(from 1 Jul 2010 to 30 Jun 2011)

Source of data: SOMIP database Jul 2010 to Jun 2011

* O/E ratio measures the difference between two points while VLAD shows the changes between two points

O/E ratios of two years

| Hospital | 2010-11 | 2011-12 |
|----------|---------|---------|
| 11 | 1.37 | 0.77 |
| 7 | 1.86 | 0.95 |
| 8 | 0.95 | 1.22 |
| 10 | 1.14 | 1.30 |
| 16 | 0.96 | 1.34 |

* Real examples of hospitals

VLAD - Hospital 8 (Emergency)

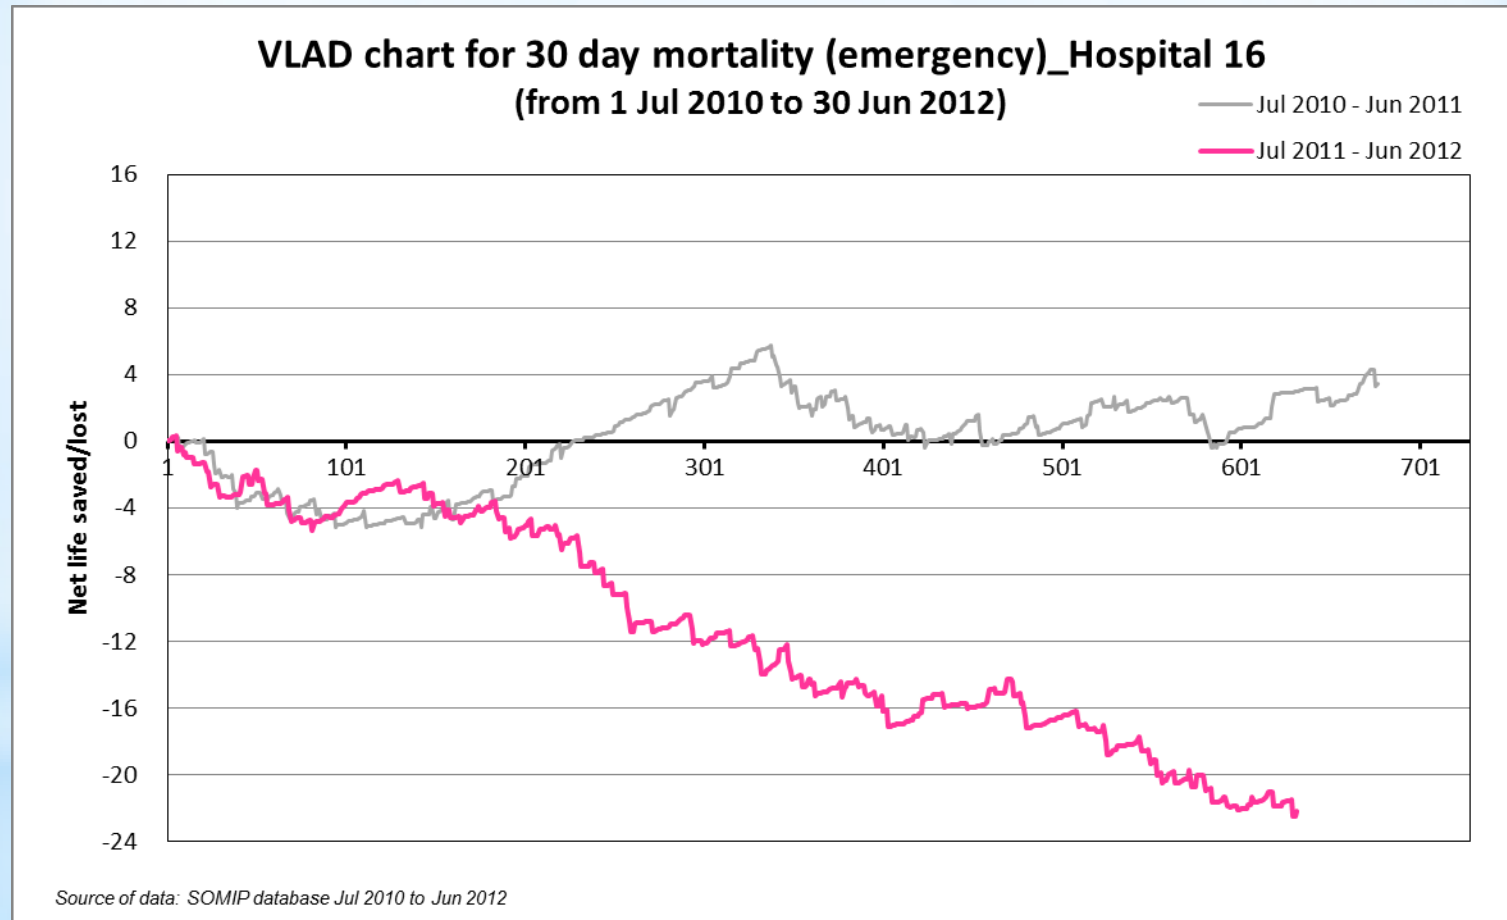

O/E ratio(10/11) : 0.95406

18

O/E ratio(11/12): 1.21865

VLAD - Hospital 16 (Emergency)

O/E ratio(10/11) : 0.95528

O/E ratio(11/12): 1.33789

VLAD - Hospital 10 (Emergency)

O/E ratio(10/11) : 1.14329

20

O/E ratio(11/12): 1.29864

VLAD - Hospital 11 (Emergency)

VLAD chart for 30 day mortality (emergency)_Hospital 11
 (from 1 Jul 2010 to 30 Jun 2012)

Source of data: SOMIP database Jul 2010 to Jun 2012

O/E ratio(10/11) : **1.36609**

O/E ratio(11/12): **0.77333**

VLAD - Hospital 7 (Emergency)

O/E ratio(10/11) : **1.85732**

O/E ratio(11/12): **0.95322**

*** Superimposing
control limits to VLAD**

30 day Mortality for Emergency Operation in Hospital 16 (from 1 Jul 2011 to 30 Jun 2012)

— LCL (90%CI)
— UCL (90%CI)
- - - LCL (95%CI)

30 day Mortality for Emergency Operation in Hospital 10 (from 1 Jul 2011 to 30 Jun 2012)

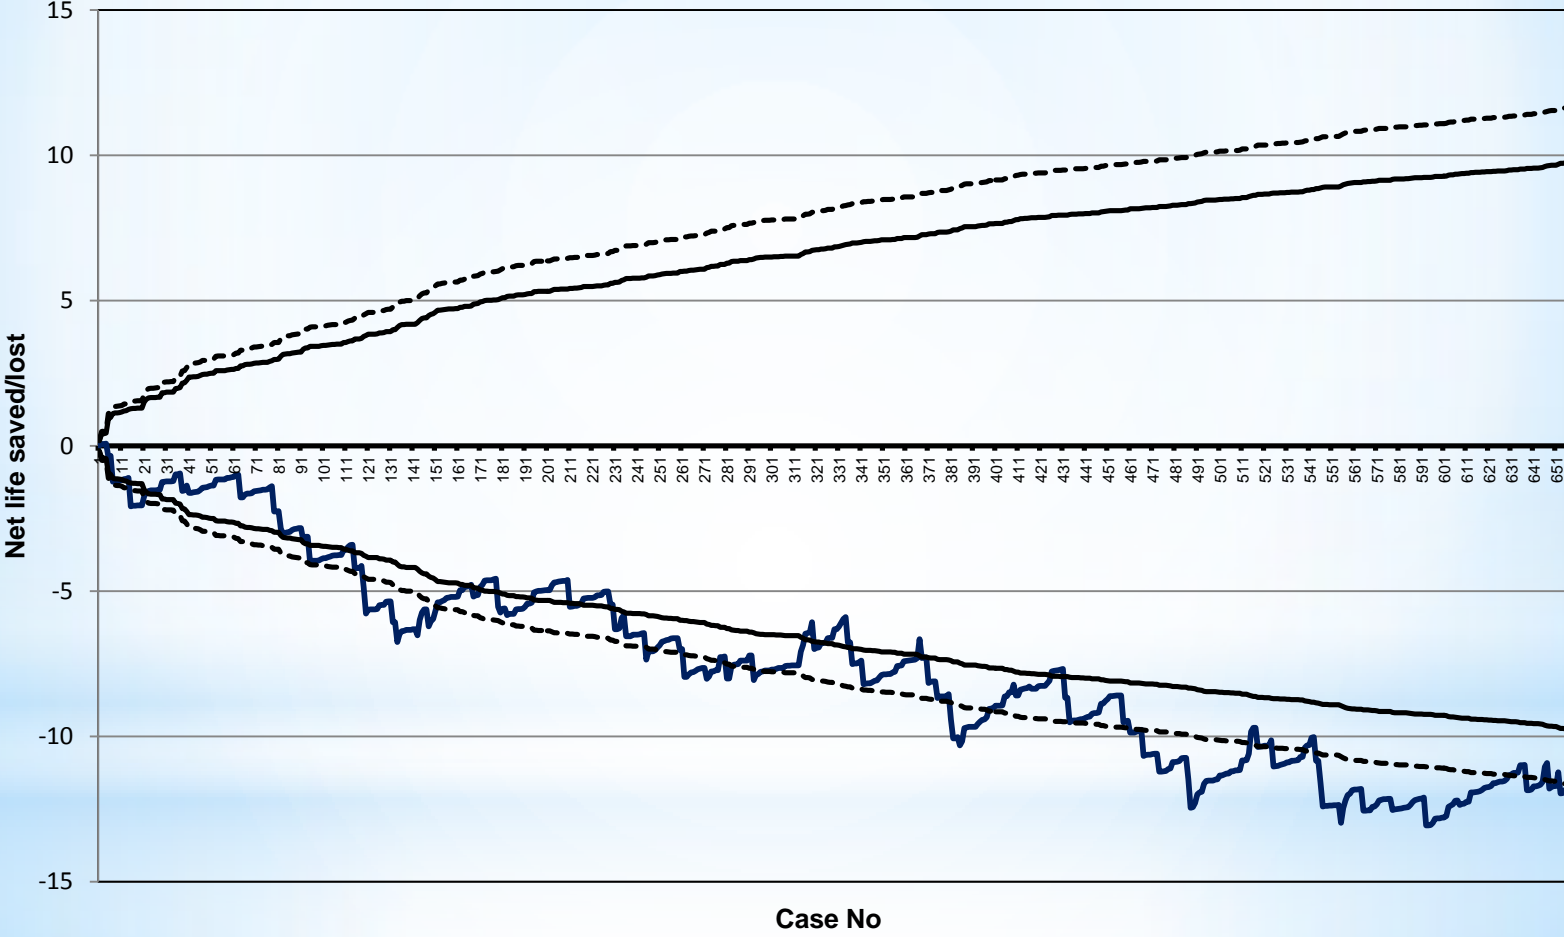

— LCL (90%CI)
 — UCL (90%CI)
 - - - LCL (95%CI)

Source of data: SOMIP database 1 Jul 2011 to 30 Jun 2012

30 day Mortality for Emergency Operation in Hospital 8 (from 1 Jul 2011 to 30 Jun 2012)

— LCL (90%CI)
 — UCL (90%CI)
 - - - LCL (95%CI)

Source of data: SOMIP database 1 Jul 2011 to 30 Jun 2012

*VLAD can prove
that SOMIP has
improved HA
surgical outcomes

VLAD - 30 day emergency mortality HA hospitals (09-12)

VLAD - 30 day elective mortality for HA hospitals (09-12)

VLAD chart for 30 day mortality (elective)_HA overall
(from 1 Jul 2009 to 30 Jun 2010)

Source of data: SOMIP database Jul 2009 to Jun 2012

VLAD chart for 30 day mortality (elective)_HA overall
(from 1 Jul 2010 to 30 Jun 2011)

Source of data: SOMIP database Jul 2009 to Jun 2012

VLAD chart for 30 day mortality (elective)_HA overall
(from 1 Jul 2011 to 30 Jun 2012)

Source of data: SOMIP database Jul 2009 to Jun 2012

- * VLAD enhances the information provided by SOMIP
- * It tells the time of changes
- * It tells the effectiveness of improvement measure

* Conclusions
