Introduction
Early detection, diagnosis and treatment of cognitive impairment in primary care setting may delay the onset of dementia or even preventing the progression of cognitive impairment (Larrieu, S. et al., 2002; Olazarán, J., Torrero, P, et.al., 2001). With the commencement of Enhanced Public and Primary care Service in KWC, occupational therapists have been developing a series of cognitive training programs in West Kowloon and East Kowloon General Outpatient Clinic. It is a new program to provide comprehensive cognitive training in the form of different groups for clients with cognitive impairment. These groups included stimulating with positive group dynamics and interaction, the cognitive training groups including information on dementia, cognitive stimulation technique, caregiver caring and home safety technique and body-mind activities, with the aims to facilitate both knowledge and skill-based empowerment.

Objectives
This satisfaction survey was to examine the clients’ satisfaction on those cognitive training groups.

Methodology
Tailor-made questionnaire was designed. It was a 10-point Likert scale to assess the level of satisfaction on (1) Knowledge (2) Usefulness (3) Helpfulness(4) Application, and (5) Overall satisfaction, as well as the response to question of "Whether advice this program to others". The questionnaire was completed by clients who attended the cognitive training groups or by the relatives who accompanied the clients.

Result
From April 2013 to February 2015, there were 223 clients from 11 cognitive groups
included in the survey. 69% of the attendants were female and the mean age was 68.8 (ranged 42 to 92). The response rate for the satisfaction survey was 82%. The average rating score for questions (1) whether improve their knowledge on dementia, (2) usefulness and (3) helpfulness on the program was 8 whereas it was 9 of the 10-point scale for questions (4) application and (5) overall satisfaction. Many respondents rated full mark (10 of the 10-point scale) in the satisfaction survey. The percentages of rating full mark for the survey questions (1) to (5) were 59%, 62%, 56%, 54% and 66% respectively. 93% of respondents commented that they would recommend the program to the others in need. The findings on this satisfaction survey showed that the clients are very satisfied with this new cognitive training program. Outcome measures on the improvement on their cognitive performance after attending the groups and sustainability on cognitive stimulation at home are recommended for further study.
