Outlines

- Conventional method to measure Adequacy of Haemodialysis (HD)
- On-line Clearance Monitoring (OCM) to measure Adequacy of Haemodialysis
- Our study to compare the above 2 methods

Adequate for your tummy?

Adequacy can be assessed by:

- **Clinical:** Patient well being
- **Nutrition:** reflected by albumin level, Protein Catabolic Rate
- **Dose of dialysis** (various dialysss indexes, especially: Kt/V)

National Cooperative Dialysis Study (NCDS)

- NCDS - evidence of **positive correlation** between **morbidity & mortality rate** of patients on HD & the **monitoring of the dose of dialysis**
- The dose of dialysis should be monitored **at least monthly**

Daugirdas 2nd generation formula

- $e^{Kt/v} = -\ln (R_{eq} - 0.008 \times t) + (4 - 3.5R_{eq}) \times UF/W$

- Kt/V = scientific index of adequacy

K = dialyzer clearance of urea (ml/min)

t = duration of dialysis (minutes)

v = volume of Urea distribution (litres)

Laboratory tests for the formula

Calculation of the result

UREA KINETIC STUDY FOR HAEMODIALYSIS

- Basic data

Name : _____ Height : _____ cm TBW = _____

Sex : _____ (M=1 ; F=2) IBW : _____ kg TBW/IBW= _____

Age : _____ B.S.A. : #NUM! sq m IBW - TBW = _____

Date	Dialyzer	No. of use	Bld flow (ml/min)	K, in vitro (ml/min)	Duration (min)	weight (kg)			peri-HD urea (mmol/L)
						pre	post	next pre	pre

--	--	--	--	--	--	--	--	--	--

Online Clearance Monitoring (OCM)

➤ Integrated into Haemodialysis machine

➤ Automatic **intra-dialytic measurement** of **in-vivo urea clearance**, & **calculation of Kt/V** throughout the treatment

Dialysis representation	Dialysis	
Diagram selection	Dialysis data	
Upper Selection	Cum. Blood Vol.	15.7 h:min
OCM-Diagram	Eff. Dialysis Time	0:55
Lower Selection	OCM	
OCM-Data	Dry weight	68.0 V(urea) 32.7
1. UF / Na Diagram	Height	169 HCT 35 h:min
2. Arterial / Venous Pressure	Age	62 Msmt.intv. 0:25
3. BPM Data (syst / diast)	Sex	♂ End Kt/V 14 h:min
4. BPM Data (MAP)	OCM	ON Goal in 2:19

Estimated anthropometric V according to the Watson formula or direct entry of a measured V

- Dry weight
- Height
- Age
- Gender

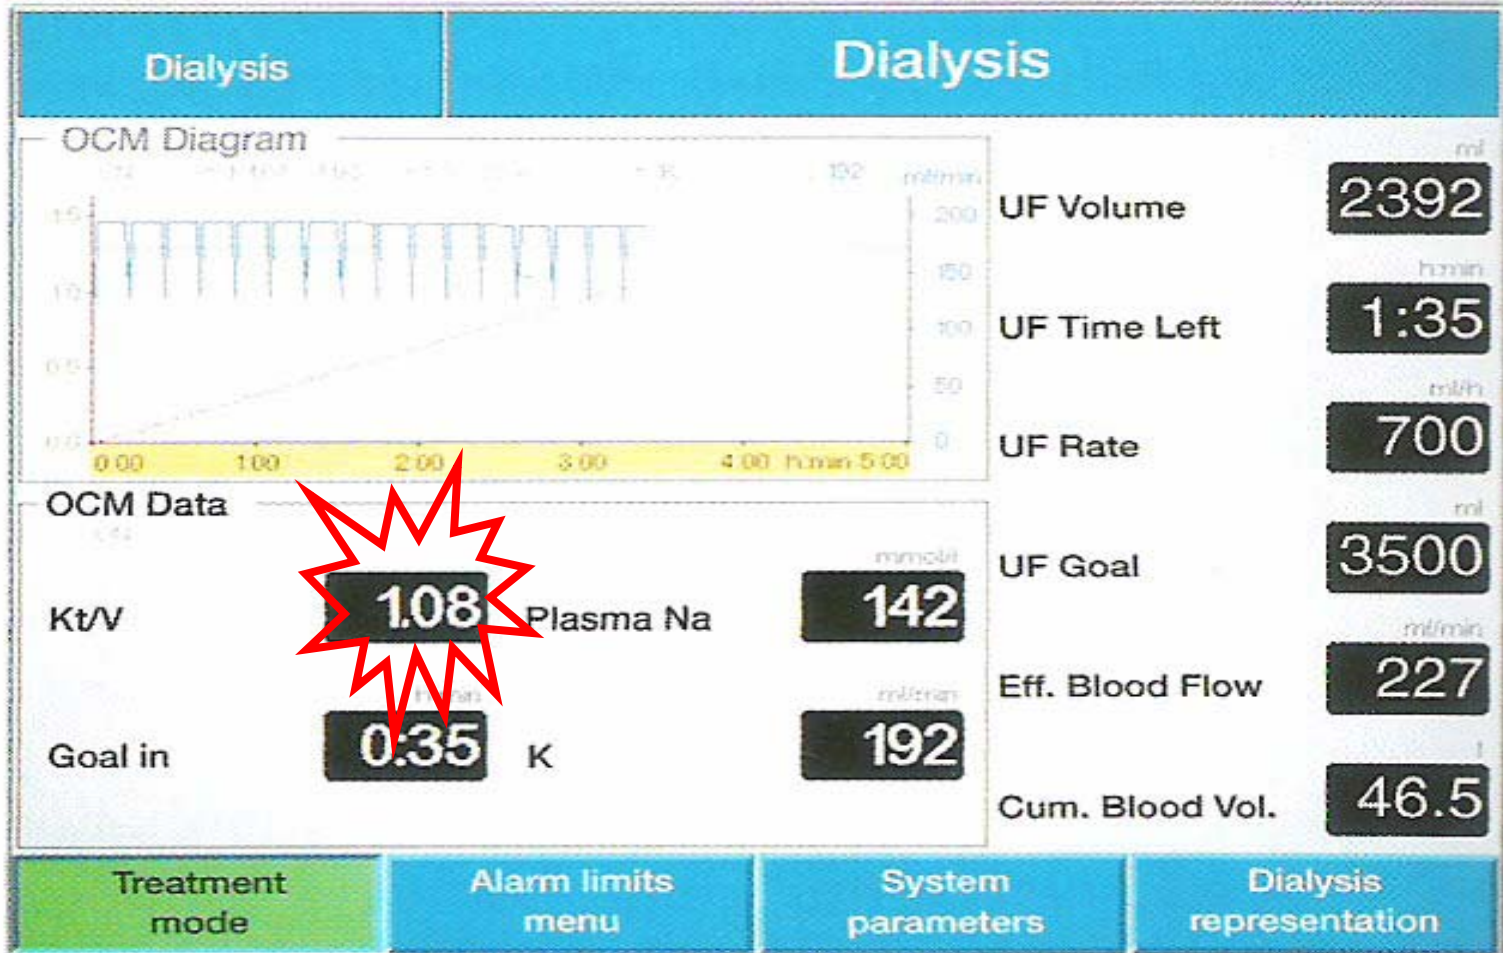

Male: $V_{urea} = 2.447 - 0.09516 \times \text{age} + 0.1074 \times \text{height} + 0.3362 \times \text{weight}$

Female: $V_{urea} = -2.097 + 0.1069 \times \text{height} + 0.2466 \times \text{weight}$

Fig. 12: A calculator to estimate the urea distribution volume V according to the anthropometric Watson formula is integrated in the OCM®

Measurement of OCM[®] Kt/V

OCM[®] Kt/V Study

Comparison of Urea Kinetic Modelings
by the non-invasive **On-line
Clearance Monitor (OCM[®]) Kt/V**

with

the **conventional Kt/V by Daugirdas
second generation formula**

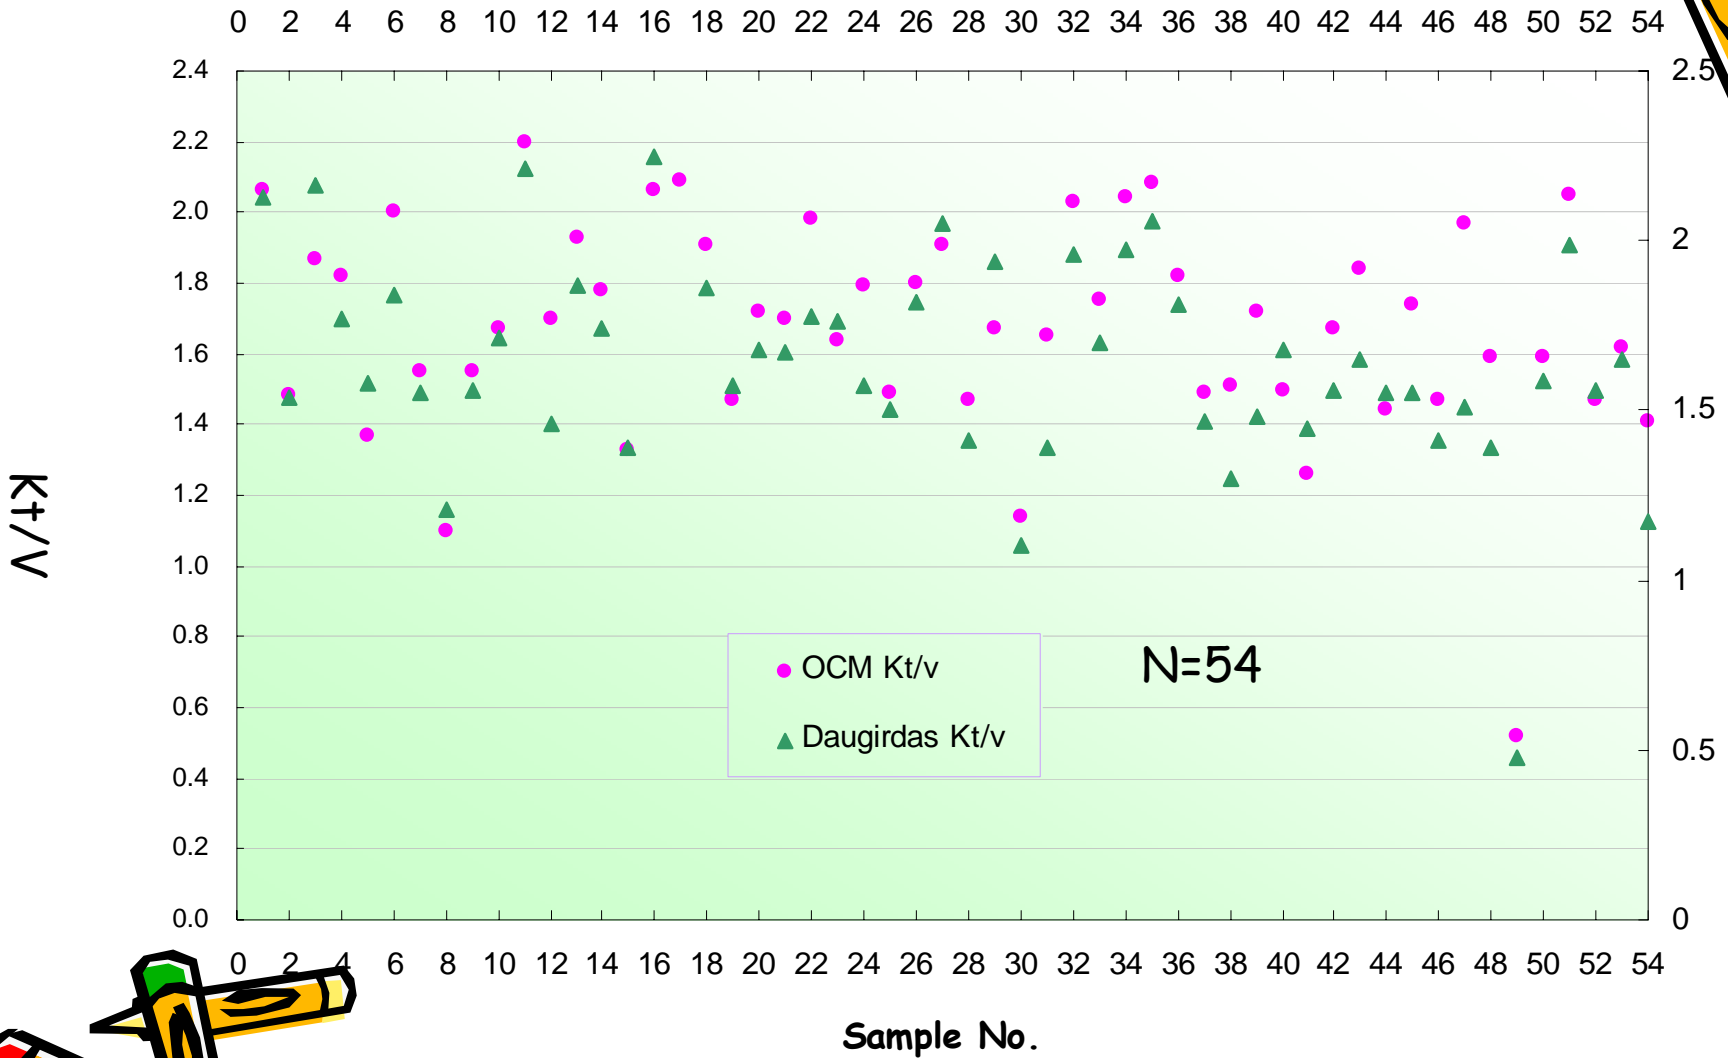

OCM[®] Kt/V Study

- 54 subjects were recruited
- Monitored with OCM[®] HD Machine
- Pre & post HD blood urea, inter-dialytic urine & the next pre RFT were taken for Daugirdas 2nd generation formula
- The results of OCM and conventional Kt/V were compared with Student t-test

OCM[®] & Daugirdas Kt/V results

Result of the study

Mean Kt/V result of OCM is **1.68** +
0.30 and the Mean of Daugirdas
Kt/V is **1.66** +
0.33

Results of the study

- Pearson correlation coefficient was **0.872**
- Paired T-test on the 2 sets of data showed **non significant differences** with **$p = 0.746$**
- **no significant difference between OCM[®] and conventional Kt/V**

Conclusion

- OCM[®] is a simpler, quicker, non-invasive & reliable method for close monitoring of haemodialysis patient adequacy with immediate result
- No extra cost & manpower required
- Timely adjustment of dialysis dose to improve patient's quality of life

This dog is having HD, how do you measure Kt/V for it?

Thank you!
