Community Care

supported by Hospital

Telemonitoring

Levels of telemonitoring

- Chronic obstructive pulmonary disease (COPD) patients
  - **Self-monitor symptoms** via COPD Assessment Test (**CAT**)
  - **Self-management** information provided according to severity of symptom score

- Patients at risk of **hypoxia** receive continuous pulse oximetry monitoring (**SpO$_2$**)

- Patients on home non-invasive ventilation (**NIV**)

NIV

SpO₂

Key Successes

Use of **technology**

- Support patients requiring **complex care**
  - Mechanical ventilation
  - Oxygen therapy

- Empower patients to self-monitor symptoms and learn disease **self-management**

- **Clinical decisions based on data** (SpO$_2$, NIV parameters, CAT scores)

Obstacles

- **Information sharing**
  - Web data cannot be accessed via CMS or ePR
  - Only Drs can read entries of staff from different disciplines
  - Nurse cannot read physiotherapist's entries and vice versa

- **Patient load**
  - Telemonitored patients are not considered as patient loads
  - Timely management requires a dedicated team that monitors & responds to patients

- **No incentive** for hospital admission avoidance in current system

- Telemonitoring requires **partnership with external equipment supplier** that provides technical support

Way forward

- **Information sharing**
  - Allow **access** to telemonitoring website on CMS
  - Open up access right to both nurses and allied health colleagues on CMS (**common electronic platform**)

- Patient load
  - Patients under telemonitoring or Hospital@Home care should be **recognised as a "patient episode"**
  - Set up a **dedicated telemonitoring Hospital@Home team**

- **Provide incentive** to hospitals to encourage avoidance of admission or early discharge to home care

- **Close liaison** with telemonitoring equipment provider
