service setting

Introduction

In ophthalmology, botulinum toxin injection is the mainstay treatment for blepharospasm and hemifacial spasm.

Objectives

This paper aims to illustrate the transition of botulinum toxin injection service, from a day surgery setting into an out-patient clinic setting.

Methodology

Descriptive analysis of the change in service delivery setting in terms of patient number, waiting time, operation time, manpower.

Result

The change in service delivery setting leads to improvement in efficiency and effectiveness in care delivery
