cold chain management standardization

GOPC

drug safety

#### **Introduction**

Refrigerated products need to be handled in a manner that ensures their quality would not be adversely affected. A comprehensive guideline of Cold Chain Management has been developed to standardize the clinic practice, temperature monitoring and contingency plan for cold chain breach among GOPCs of Hong Kong West Cluster.

#### **Objectives**

- To standardize the practice of cold chain management among all GOPCs in HKWC.
- To provide guidance on the temperature monitoring procedure of pharmaceutical refrigerators in GOPCs
- To enhance medication safety and provision of quality care to patients.
- To minimize incidents associated with handling of refrigerated medications/ vaccines.

#### **Methodology**

The Cold Chain Management guideline was developed by the department project team members in 2015. To prepare for its implementation, the standardized drug fridges, temperature monitoring devices and related equipment were equipped in each of the GOPCs. The five phases of implementation included:

1. Development of training packages (2 months)
2. Training and delivering tools to nursing staffs (2 months)
3. Demonstration of daily practice and workflow for cold chain breach (1 month)
4. Rolling out of project among all GOPCs (1 month)
5. Evaluation – The compliance audit on Cold Chain Management was conducted in Nov 2016.

#### **Result**

The compliance audit was conducted among 5 GOPCs of HKWC. It showed smooth implementation among all clinics. All clinics are equipped with the standardized equipment and clinic staff are well trained on the Cold Chain Management, with 100% compliance on refrigerated products storage practice, daily temperature monitoring, documentation, counter-checking and practice on reporting of temperature excursion. The project provides guidance on requirements and maintenance on the storage equipment, and the temperature monitoring procedure of pharmaceutical refrigerators in GOPCs (HKWC) to maintain the cold chain and safeguard the quality of vaccine and medication. The medication safety and provision of quality care to patients has been enhanced and associated incidents has been minimized. The suggested appropriate response to medication incidents and actions to be taken in response to cold storage breach situation of the pharmaceutical refrigerators has been established
